

Put one AI decision on a page.

Choose one workflow where an AI recommendation could influence a consequential action. Complete this with the person accountable for that decision. Use public or synthetic information for an initial discussion.

1 Decision and consequence

What is proposed? What triggers it? What changes if someone accepts it?

2 Evidence and source versions

Which documents, observations or system records support it? What is assumed?

3 Conflict and counter-evidence

What contradicts the proposal? What missing fact should pause the decision?

4 Accountable authority

Which named person or role may accept, reject, escalate or stop this decision?

5 Permitted action boundary

What may the AI read, draft or recommend? Which actions require approval?

6 Record and evaluation

What must be saved? How will you distinguish the proposal, decision, action and outcome?

When the documents disagree.

Synthetic example. This illustrates a review method; it is not a customer case, software demonstration or operating instruction.

The question

"Can this change proceed after one reviewer approves it?"

Document A, version 1: one reviewer is required.

Document B, version 2: two reviewers are required.

Neither document establishes precedence or supersedes the other.

The useful response

"The sources disagree. Document A requires one reviewer; Document B requires two. I cannot establish which rule applies from these documents. The designated policy owner must resolve the conflict before this answer can support an action."

A newer version number alone does not establish that one document overrides a different document. Keep the unresolved point visible.

What to record

Sources: Document IDs, versions, relevant passages and access context.

Open issue: Required reviewer count is unresolved; precedence is not established.

Authority: Designated policy owner: TBD. Assign a real owner before use.

Action state: Recommendation held; no operational approval is implied.

Resolution: Owner, decision, reason, time and the governing source once confirmed.

A practical evaluation

Check whether the conflict is exposed, both sources are traceable and the unresolved conclusion is kept separate from an authorised decision. A fluent answer that silently chooses a rule fails this example.

Bring us one consequential AI decision.
